Robust Output Feedback H Infinity

"Robust Output Feedback H-infinity Control and Filtering for Uncertain Linear Systems" discusses new and meaningful findings on robust output feedback H-infinity control and filtering for uncertain linear systems, presenting a number of useful and less conservative design results based on the linear matrix inequality (LMI) technique.

This paper presents a robust static output feedback H(infinity) algorithm for control of hysteretic civil engineering structures subjected to earthquake ground motions. Hysteretic structures present a problem for control design and algorithm development due to changes in the structural parameters during large seismic events.

This paper proposes a robust H-infinity control design of a single unit differential type Wheeled Mobile Robot. Mobile robots are non holonomic systems as their constraint equations are not integrable. Considering the constraints and combining the kinematics and dynamics of the system, a linearized model is obtained.

Abstract This paper designs an dynamic output feedback controller for uncertain stochastic systems with multiplicative noises with the robust H infin control problem. Sufficient conditions are given for the multi-objective controller design problem in terms of certain linear matrix inequalities (LMIs).

For the robust static output feedback H^∞ controller, the norm bounded uncertainty is considered to simulate the variation of vehicle forward velocity uncertainty. The robust controller is designed to check the lateral stability of the bus at different forward velocity and at different velocity uncertainty.

H -infinity control theory deals with the minimization of the H -infinity-norm of the transfer matrix from an exogenous disturbance to a pertinent controlled output of a given plant.

Robust and H^∞ Control | SpringerLink

H^∞ (i.e. "H-infinity") methods are used in control theory to synthesize controllers to achieve stabilization with guaranteed performance. To use H^∞ methods, a control designer expresses the control problem as a mathematical optimization problem and then finds the controller that solves this optimization.

This paper demonstrates an approach to frequency domain identification for the explicit purpose of designing robust H(infinity) controllers. The approach transforms raw experimental data into a plant set estimate directly usable by modern robust control design software(e.g., Matlab Robust Control Toolboxes [11][2]).
